

Requirements Table

Name: Chiranthan Sathrasala

SRN: PES1UG24CS565

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale	Comments
FR-001	Functional	The system shall allow a Campus Admin to define and allocate a maximum annual budget limit for each registered student club.	High	Pass: Admin successfully sets a ₹50,000 limit, and the club's dashboard reflects this cap.	Establishes the baseline for financial constraints.	<i>Needs clarification on whether unused budget can roll over to the next academic year.</i>
FR-002	Functional	The system shall allow the Club Lead to create multiple ticket tiers (e.g., General Entry, VIP) and set capacities for an approved event.	High	Pass: Club Lead creates 50 VIP tickets and 200 General tickets, which correctly display on the event page.	Enables tiered event access and capacity control.	<i>Consider adding a constraint or approval requirement if the ticket price exceeds a certain threshold.</i>
FR-003	Functional	The system shall enable an Attendee to purchase an event ticket using the integrated campus digital currency or standard payment gateways.	High	Pass: Ticket is successfully purchased and funds are deducted from the user's wallet/account.	Core monetization and ticketing function.	<i>Good clarity, but we should probably specify exactly which payment gateways will be supported (e.g., Razorpay, BillDesk).</i>

FR-004	Functional	The system shall automatically generate and email a PDF receipt containing a secure QR-code to the Attendee upon successful payment.	High	Pass: Email arrives within 2 minutes of payment with a scannable QR code attached.	Provides the attendee with proof of purchase and entry criteria.	<i>Consider adding a fallback notification, such as an SMS with a link to the ticket, in case the email goes to spam.</i>
FR-005	Functional	The system shall provide a real-time attendance dashboard for the Club Lead, updating as QR codes are scanned at the venue.	Medium	Pass: Dashboard counter increments immediately when an attendee's QR code is successfully validated.	Crucial for venue capacity and crowd management.	<i>To make this strictly testable, we should define "real-time" (e.g., UI updates within 1 second of scan).</i>
NFR-001	Nonfunctional	The system shall support a minimum of 500 concurrent users during peak ticket sale windows without exceeding a 2-second page load time.	High	Pass: Load testing confirms 95% of requests complete in under 2 seconds with 500 active users.	Prevents system crashes during highly anticipated club events.	<i>Highly testable. We might need to specify the assumed server environment for these benchmarking tests.</i>
NFR-002	Nonfunctional	The system shall encrypt all payment transactions and user session data in transit using TLS 1.3 protocols.	High	Pass: Security audits confirm TLS 1.3 is enforced and older protocols are blocked.	Protects sensitive financial and student data from interception.	<i>This covers data in transit well, but do we need a separate NFR for encrypting user data at rest in the database?</i>
